

Summer is Here!

Long, hot and sunny days create plenty of activity in the great outdoors, where we and our pets head for during the warmer months. Whether it be on the beach, in our own gardens, the park or countryside, just as with other seasons in the year, there are a few factors to take into consideration regarding the safety and welfare of our pets, and summer is no exception.

Flora and Fauna

Grass seeds are quite small, but can cause big problems for your dogs, as they may become embedded in their feet, ears and eyes. Seeds can even be inhaled, and lodge in the nose or sit in an airway to the lungs. Those breeds with longer ears and coats or 'feathery' feet, are magnets for grass seeds!

Regularly inspect your pet's coat and body especially after exercise.

Pay careful attention to their feet, eyes and ears.

Trim hair around the ears and under the ear flap.

Keep hair short between pads and toes.

The most common seeds we see are the small round and arrow shaped seeds, the latter has a very sharp tip, so can burrow and pierce the skin.

Seed Signs to look out for:

- Licking Paws ● Pawing at eyes
- Red swelling between toes
- Excessive ear scratching or shaking of head
- Sneezing ● Coughing

As with any unusual behaviour or signs of illness, always contact us for advice.

Summer 2018

Parasite Paradiseis your pet!

With warmer temperatures and humid conditions in the summer, fleas and ticks really do ramp up their activity, so it is very important to ensure your pets have not only preventative, but also effective care. For those cats and dogs with no protection against **fleas and ticks**, these parasites can choose your pet as the perfect place to live. These blood sucking parasites will certainly make a meal out of your pet, and cause major irritation. **Fleas**, plenty of scratching, sore skin, and if they really get stuck in, even weight loss and anaemia, especially in young animals. **Ticks** may attach to and then feed from your pet, and can transmit **Lyme Disease**, which affects the nerves and muscles.

There are many products available to combat fleas and ticks, so please discuss with our team, which would be suitable for your pet. As fleas are a year round problem, ensure you protect your dog or cat in the cooler months too!

Hot Dogs!

Even with all the campaigns and media reports, there are still people who think it is okay to leave their dog shut in a car on a hot day! **NEVER leave your pet in the car**, not even for a short while, not even in the shade, not even with the windows open. Vehicles very quickly reach oven-like temperatures, and **your pet will literally cook in minutes!**

Buzzing Flies!

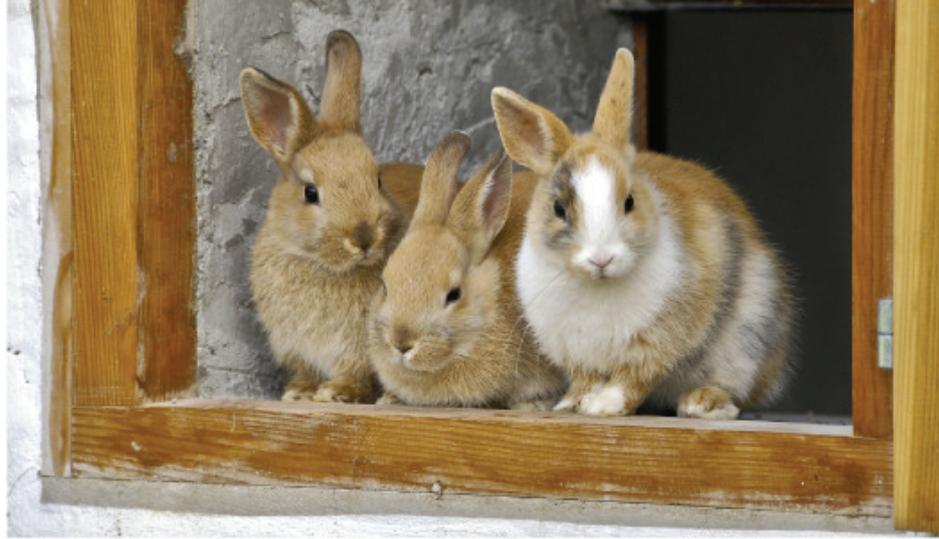

Hopping along to another problem during the warmer months, is **FLYSTRIKE**. If a rabbit's hindquarters become moist, dirty and sore, flies are attracted to this area, where they can lay eggs. The hatching maggots will then literally feed on the rabbit's skin and underlying tissue. Flystrike is a very serious and painful condition, which requires immediate veterinary treatment, as sadly it can often be fatal. **Flystrike is real emergency, so please do contact us quickly!**

Help to protect your rabbit

On a daily basis, fully inspect their hindquarters to ensure they are clean, dry, egg and maggot free, and remove soiled bedding and waste material. Clean hutches frequently.

If your rabbit appears to have a regular rear end soiling problem, bring bunny along for a check-up. Overgrown teeth and claws or obesity may be preventing your rabbit from grooming properly. Also talk with us about the protective sprays, which are available.

Your Pets Love Summer too

SO..... In hot and sunny temperatures you should always be aware that your pets could suffer from **heatstroke (hyperthermia)** - a rise in body temperature. Animals cooling systems are not as efficient as humans, and they can very quickly overheat and dehydrate. If their temperature reaches too high a level, serious damage may occur to organs and the cell system. In severe cases this can be fatal, so it is a very good idea to **aim** to prevent heatstroke in your pets by:

Exercising pets in the cooler morning or evening air and don't over exert.

Ensure there is access to shady cooler areas in and outdoors.

Regulate your pets' time spent lying in the sun and heat, in the garden and indoors, **especially your conservatories!**

Provide plenty of fresh clean drinking water.

Place rabbit and guinea pig housing, outside run and drinking water in the shade and ensure the hutch has good ventilation.

Extra care should be taken with those pets that are overweight, elderly, have heart conditions, breathing problems or have long/thick coats.

Recognise the signs of heatstroke

- increased panting
- excessive/thick saliva
- pacing/distressed
- dark gums
- lethargy
- unwilling/unable to rise
- vomiting
- dizziness/disorientation
- collapse
- loss of consciousness

Take prompt action by moving your pet to a cool area, and contact us immediately.

Having a B-B-Q?

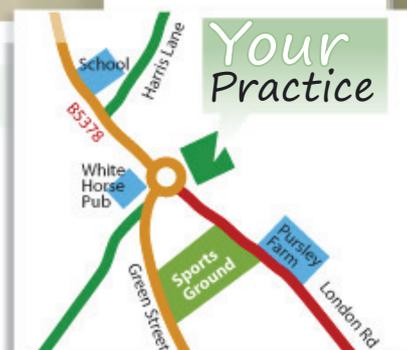

A warm Saturday evening or sunny Sunday, and out come the barbecues, not only to the delight of humans, but also to our cats and dogs! As eating outside is a far more relaxed affair, this provides our pets with the perfect opportunity for stealing **rib and chicken bones** from your casually placed plate on the grass, and also raiding the black bin bag for **corn on the cob husks!** All of these left-over foods, if devoured by your pet, can get lodged in the mouth, throat and stomach, some of which may require surgical removal.

Any signs of pawing at the mouth, retching, vomiting, lethargy, not eating or drinking, then do not delay in contacting us.
